# Lecture 1: Introduction to Reinforcement Learning

David Silver

#### Outline

- 1 Admin
- 2 About Reinforcement Learning
- 3 The Reinforcement Learning Problem
- 4 Inside An RL Agent
- 5 Problems within Reinforcement Learning

ecture 1: Introduction to Reinforcement Learnin

\_ Admin

#### Class Information

- Thursdays 9:30 to 11:00am
- Website:

http://www.cs.ucl.ac.uk/staff/D.Silver/web/Teaching.html

- Group
  - http://groups.google.com/group/csml-advanced-topics
- Contact me: d.silver@cs.ucl.ac.uk

#### Lecture 1: Introduction to Reinforcement Learning

LAdmir

#### Assessment

- Assessment will be 50% coursework, 50% exam
- Coursework
  - Assignment A: RL problem
  - Assignment B: Kernels problem
  - Assessment = max(assignment1, assignment2)
- Examination
  - A: 3 RL questions
  - B: 3 kernels questions
  - Answer any 3 questions

ecture 1: Introduction to Reinforcement Learnin

# Textbooks

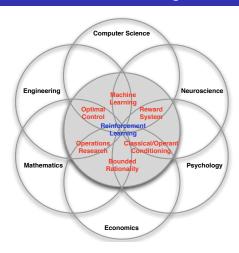

Lecture 1: Introduction to Reinforcement Learning

About RL

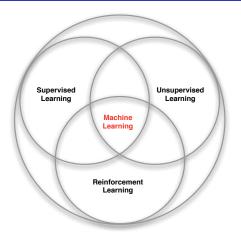

#### An Introduction to Reinforcement Learning, Sutton and Barto, 1998

- MIT Press, 1998
  - $\sim$  40 pounds
- Available free online!
- http://webdocs.cs.ualberta.ca/~sutton/book/the-book.html
- Algorithms for Reinforcement Learning, Szepesvari
  - Morgan and Claypool, 2010
  - $\sim 20$  pounds
  - Available free online!
  - $http://www.ualberta.ca/{\sim} szepesva/papers/RLAlgsInMDPs.pdf$

# Many Faces of Reinforcement Learning

# Branches of Machine Learning

# Characteristics of Reinforcement Learning

What makes reinforcement learning different from other machine learning paradigms?

- There is no supervisor, only a *reward* signal
- Feedback is delayed, not instantaneous
- Time really matters (sequential, non i.i.d data)
- Agent's actions affect the subsequent data it receives

ecture 1: Introduction to Reinforcement Learnin

LAbout RL

Lecture 1: Introduction to Reinforcement Learning

#### **Examples of Reinforcement Learning**

#### ■ Fly stunt manoeuvres in a helicopter

- Defeat the world champion at Backgammon
- Manage an investment portfolio
- Control a power station
- Make a humanoid robot walk
- Play many different Atari games better than humans

#### Helicopter Manoeuvres

Lecture 1: Introduction to Reinforcement Learnin

Lecture 1: Introduction to Reinforcement Learning

Bipedal Robots

Atari

#### Rewards

- $\blacksquare$  A reward  $R_t$  is a scalar feedback signal
- Indicates how well agent is doing at step t
- The agent's job is to maximise cumulative reward

Reinforcement learning is based on the reward hypothesis

#### Definition (Reward Hypothesis)

All goals can be described by the maximisation of expected cumulative reward

Do you agree with this statement?

#### Examples of Rewards

- Fly stunt manoeuvres in a helicopter
  - +ve reward for following desired trajectory
  - -ve reward for crashing
- Defeat the world champion at Backgammon
  - +/-ve reward for winning/losing a game
- Manage an investment portfolio
  - +ve reward for each \$ in bank
- Control a power station
  - +ve reward for producing power
  - ve reward for exceeding safety thresholds
- Make a humanoid robot walk
  - +ve reward for forward motion
  - -ve reward for falling over
- Play many different Atari games better than humans
  - +/-ve reward for increasing/decreasing score

Lecture 1: Introduction to Reinforcement Learnin

The RL Problem

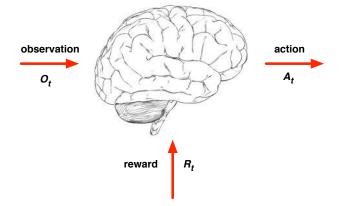

Sequential Decision Making

Lecture 1: Introduction to Reinforcement Learning

The RL Problem

#### Agent and Environment

- Goal: select actions to maximise total future reward
- Actions may have long term consequences
- Reward may be delayed
- It may be better to sacrifice immediate reward to gain more long-term reward
- Examples:
  - A financial investment (may take months to mature)
  - Refuelling a helicopter (might prevent a crash in several hours)
  - Blocking opponent moves (might help winning chances many moves from now)

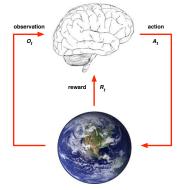

ecture 1: Introduction to Reinforcement Learning

The RL Problem

Agent and Environm

# Agent and Environment

- At each step *t* the agent:
  - Executes action A<sub>t</sub>
  - Receives observation  $O_t$
  - Receives scalar reward  $R_t$
- The environment:
  - $\blacksquare$  Receives action  $A_t$
  - Emits observation  $O_{t+1}$
  - Emits scalar reward  $R_{t+1}$
- t increments at env. step

The RL Problem

#### History and State

■ The history is the sequence of observations, actions, rewards

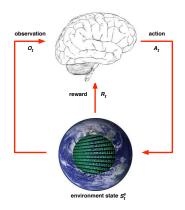

$$H_t = O_1, R_1, A_1, ..., A_{t-1}, O_t, R_t$$

- $\blacksquare$  i.e. all observable variables up to time t
- i.e. the sensorimotor stream of a robot or embodied agent
- What happens next depends on the history:
  - The agent selects actions
  - The environment selects observations/rewards
- State is the information used to determine what happens next
- Formally, state is a function of the history:

$$S_t = f(H_t)$$

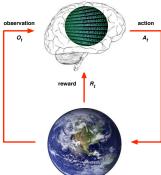

Agent State

#### **Environment State**

- The environment state  $S_t^e$  is the environment's private representation
- i.e. whatever data the environment uses to pick the next observation/reward
- The environment state is not usually visible to the agent
- Even if  $S_t^e$  is visible, it may contain irrelevant information

- The agent state  $S_t^a$  is the agent's internal representation
- i.e. whatever information the agent uses to pick the next action
- i.e. it is the information used by reinforcement learning algorithms
- It can be any function of history:

$$S_t^a = f(H_t)$$

The RL Problem

### Information State

An information state (a.k.a. Markov state) contains all useful information from the history.

#### Definition

A state  $S_t$  is Markov if and only if

$$\mathbb{P}[S_{t+1} \mid S_t] = \mathbb{P}[S_{t+1} \mid S_1, ..., S_t]$$

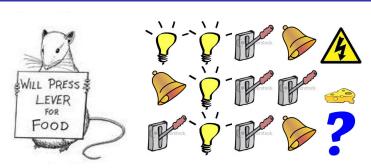

• "The future is independent of the past given the present"

$$H_{1:t} \to S_t \to H_{t+1:\infty}$$

- Once the state is known, the history may be thrown away
- i.e. The state is a sufficient statistic of the future
- The environment state  $S_{\star}^{e}$  is Markov
- The history  $H_t$  is Markov

-The RL Problem

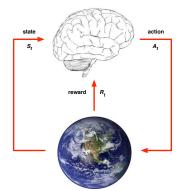

#### Rat Example

- What if agent state = last 3 items in sequence?
- What if agent state = counts for lights, bells and levers?
- What if agent state = complete sequence?

The RL Problem

#### Fully Observable Environments

Full observability: agent directly observes environment state

$$O_t = S_t^a = S_t^e$$

- Agent state = environment state = information state
- Formally, this is a Markov decision process (MDP)
- (Next lecture and the majority of this course)

The RL Problem

#### Partially Observable Environments

- Partial observability: agent indirectly observes environment:
  - A robot with camera vision isn't told its absolute location
  - A trading agent only observes current prices
  - A poker playing agent only observes public cards
- Now agent state ≠ environment state
- Formally this is a partially observable Markov decision process (POMDP)
- Agent must construct its own state representation  $S_t^a$ , e.g.
  - Complete history:  $S_t^a = H_t$
  - Beliefs of environment state:  $S_t^a = (\mathbb{P}[S_t^e = s^1], ..., \mathbb{P}[S_t^e = s^n])$
  - Recurrent neural network:  $S_t^a = \sigma(S_{t-1}^a W_s + O_t W_o)$

# Major Components of an RL Agent

# Policy

- An RL agent may include one or more of these components:
  - Policy: agent's behaviour function
  - Value function: how good is each state and/or action
  - Model: agent's representation of the environment

- A policy is the agent's behaviour
- It is a map from state to action, e.g.
- Deterministic policy:  $a = \pi(s)$
- Stochastic policy:  $\pi(a|s) = \mathbb{P}[A_t = a|S_t = s]$

Lecture 1: Introduction to Reinforcement Learnin

Inside An RL Agent

Lecture 1: Introduction to Reinforcement Learning

└-Inside An RL Agent

#### Value Function

#### Example: Value Function in Atari

■ Value function is a prediction of future reward

- Used to evaluate the goodness/badness of states
- And therefore to select between actions, e.g.

$$v_{\pi}(s) = \mathbb{E}_{\pi} \left[ R_{t+1} + \gamma R_{t+2} + \gamma^2 R_{t+3} + \dots \mid S_t = s \right]$$

Lecture 1: Introduction to Reinforcement Learnir Lanside An RL Agent Lecture 1: Introduction to Reinforcement Learning
LInside An RL Agent

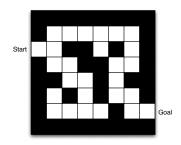

Maze Example

#### Model

#### ■ A model predicts what the environment will do next

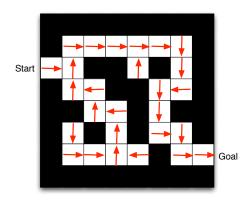

- lacksquare  $\mathcal P$  predicts the next state
- lacksquare  $\mathcal R$  predicts the next (immediate) reward, e.g.

$$\begin{aligned} \mathcal{P}_{ss'}^{a} &= \mathbb{P}[S_{t+1} = s' \mid S_t = s, A_t = a] \\ \mathcal{R}_{s}^{a} &= \mathbb{E}\left[R_{t+1} \mid S_t = s, A_t = a\right] \end{aligned}$$

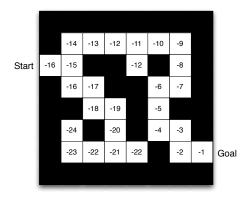

- Rewards: -1 per time-step
- Actions: N, E, S, W
- States: Agent's location

# Maze Example: Policy

■ Arrows represent policy  $\pi(s)$  for each state s

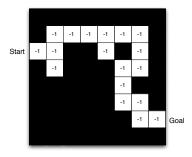

#### Maze Example: Value Function

■ Numbers represent value  $v_{\pi}(s)$  of each state s

Inside An RL Agent

#### Maze Example: Model

- Agent may have an internal model of the environment
- Dynamics: how actions change the state
- Rewards: how much reward from each state
- The model may be imperfect
- $\blacksquare$  Grid layout represents transition model  $\mathcal{P}^{a}_{ss'}$
- lacksquare Numbers represent immediate reward  $\mathcal{R}_s^a$  from each state s(same for all a)

#### └-Inside An RL Agent

#### Categorizing RL agents (1)

- Value Based
  - No Policy (Implicit)
  - Value Function
- Policy Based
  - Policy
  - No Value Function
- Actor Critic
  - Policy
  - Value Function

#### ■ Model Free

- Policy and/or Value Function
- No Model
- Model Based
  - Policy and/or Value Function
  - Model

# RL Agent Taxonomy

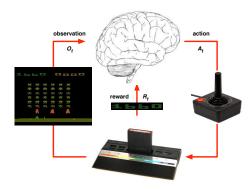

### Learning and Planning

Two fundamental problems in sequential decision making

- Reinforcement Learning:
  - The environment is initially unknown
  - The agent interacts with the environment
  - The agent improves its policy
- Planning:
  - A model of the environment is known
  - The agent performs computations with its model (without any external interaction)
  - The agent improves its policy
  - a.k.a. deliberation, reasoning, introspection, pondering, thought, search

#### Atari Example: Reinforcement Learning

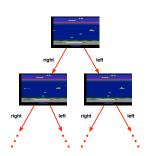

- Rules of the game are unknown
- Learn directly from interactive game-play
- Pick actions on joystick, see pixels and scores

Lecture 1: Introduction to Reinforcement Learnin

Problems within RL

#### Atari Example: Planning

- Rules of the game are known
- Can query emulator
  - perfect model inside agent's brain
- If I take action a from state s:
  - what would the next state be?
  - what would the score be?
- Plan ahead to find optimal policy
  - e.g. tree search

Lecture 1: Introduction to Reinforcement Learning

└─Problems within RL

#### Exploration and Exploitation (1)

- Reinforcement learning is like trial-and-error learning
- The agent should discover a good policy
- From its experiences of the environment
- Without losing too much reward along the way

ecture 1: Introduction to Reinforcement Learning

Problems within RI

# Exploration and Exploitation (2)

- **Exploration** finds more information about the environment
- Exploitation exploits known information to maximise reward
- It is usually important to explore as well as exploit

Lecture 1: Introduction to Reinforcement Learning

Problems within RL

#### Examples

■ Restaurant Selection

Exploitation Go to your favourite restaurant Exploration Try a new restaurant

Online Banner Advertisements

Exploitation Show the most successful advert Exploration Show a different advert

Oil Drilling

Exploitation Drill at the best known location Exploration Drill at a new location

■ Game Playing

Exploitation Play the move you believe is best Exploration Play an experimental move

#### Prediction and Control

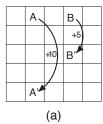

# Gridworld Example: Prediction

■ Prediction: evaluate the future

■ Given a policy

■ Control: optimise the future

Find the best policy

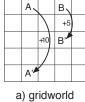

3.3	8.8	4.4	5.3	1.5
1.5	3.0	2.3	1.9	0.5
0.1	0.7	0.7	0.4	-0.4
-1.0	-0.4	-0.4	-0.6	-1.2
-1.9	-1.3	-1.2	-1.4	-2.0
(b)				

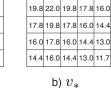

What is the value function for the uniform random policy?

Problems within RL

Course Outline

#### Gridworld Example: Control

22.0 24.4 22.0 19.4 17.5

What is the optimal value function over all possible policies? What is the optimal policy?

#### Course Outline

- Part I: Elementary Reinforcement Learning
  - 1 Introduction to RL
  - 2 Markov Decision Processes
  - 3 Planning by Dynamic Programming
  - 4 Model-Free Prediction
  - 5 Model-Free Control
- Part II: Reinforcement Learning in Practice
  - 1 Value Function Approximation
  - 2 Policy Gradient Methods
  - 3 Integrating Learning and Planning
  - 4 Exploration and Exploitation
  - 5 Case study RL in games
