- 1 Markov Processes
- 2 Markov Reward Processes
- 3 Markov Decision Processes
- 4 Extensions to MDPs

Markov Processes

#### Introduction to MDPs

- Markov decision processes formally describe an environment for reinforcement learning
- Where the environment is fully observable
- i.e. The current *state* completely characterises the process
- Almost all RL problems can be formalised as MDPs, e.g.
  - Optimal control primarily deals with continuous MDPs
  - Partially observable problems can be converted into MDPs
  - Bandits are MDPs with one state

-Markov Processes

Markov Property

"The future is independent of the past given the present"

#### Definition

A state  $S_t$  is Markov if and only if

$$\mathbb{P}[S_{t+1} \mid S_t] = \mathbb{P}[S_{t+1} \mid S_1, ..., S_t]$$

- The state captures all relevant information from the history
- Once the state is known, the history may be thrown away
- i.e. The state is a sufficient statistic of the future

Markov Processes

-Markov Processes

#### Markov Process

# State Transition Matrix

For a Markov state s and successor state s', the state transition probability is defined by

$$\mathcal{P}_{ss'} = \mathbb{P}\left[S_{t+1} = s' \mid S_t = s\right]$$

State transition matrix  ${\cal P}$  defines transition probabilities from all states s to all successor states s',

$$\mathcal{P} = \textit{from} \begin{bmatrix} \mathcal{P}_{11} & \dots & \mathcal{P}_{1n} \\ \vdots & & \\ \mathcal{P}_{n1} & \dots & \mathcal{P}_{nn} \end{bmatrix}$$

where each row of the matrix sums to 1.

A Markov process is a memoryless random process, i.e. a sequence of random states  $S_1, S_2, ...$  with the Markov property.

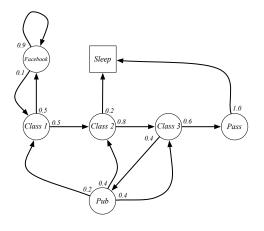

#### Definition

A Markov Process (or Markov Chain) is a tuple  $\langle \mathcal{S}, \mathcal{P} \rangle$ 

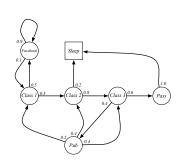

- $\blacksquare$   $\mathcal{S}$  is a (finite) set of states
- $\blacksquare \mathcal{P}$  is a state transition probability matrix,

$$\mathcal{P}_{ss'} = \mathbb{P}\left[S_{t+1} = s' \mid S_t = s\right]$$

## Example: Student Markov Chain

-Markov Processes

## Example: Student Markov Chain Transition Matrix

#### Markov Reward Process

A Markov reward process is a Markov chain with values.

#### Definition

A Markov Reward Process is a tuple  $\langle S, \mathcal{P}, \mathcal{R}, \gamma \rangle$ 

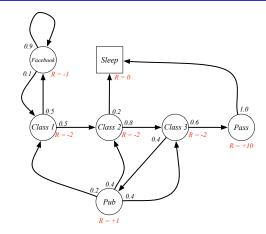

- lacksquare  $\mathcal S$  is a finite set of states
- lacksquare P is a state transition probability matrix,

$$\mathcal{P}_{ss'} = \mathbb{P}\left[S_{t+1} = s' \mid S_t = s\right]$$

- **Proof**  $\mathcal{R}$  is a reward function,  $\mathcal{R}_s = \mathbb{E}\left[R_{t+1} \mid S_t = s\right]$
- $ightharpoonup \gamma$  is a discount factor,  $\gamma \in [0,1]$

#### Return

# Example: Student MRP

#### Definition

The return  $G_t$  is the total discounted reward from time-step t.

$$G_t = R_{t+1} + \gamma R_{t+2} + \dots = \sum_{k=0}^{\infty} \gamma^k R_{t+k+1}$$

- The *discount*  $\gamma \in [0,1]$  is the present value of future rewards
- The value of receiving reward R after k+1 time-steps is  $\gamma^k R$ .
- This values immediate reward above delayed reward.
  - $\ \ \, \gamma$  close to 0 leads to "myopic" evaluation
  - $\ \ \, \gamma$  close to 1 leads to "far-sighted" evaluation

# Why discount?

Value Function

Most Markov reward and decision processes are discounted. Why?

- Mathematically convenient to discount rewards
- Avoids infinite returns in cyclic Markov processes
- Uncertainty about the future may not be fully represented
- If the reward is financial, immediate rewards may earn more interest than delayed rewards
- Animal/human behaviour shows preference for immediate
- It is sometimes possible to use undiscounted Markov reward processes (i.e.  $\gamma=1$ ), e.g. if all sequences terminate.

The value function v(s) gives the long-term value of state s

The state value function v(s) of an MRP is the expected return starting from state s

$$v(s) = \mathbb{E}\left[G_t \mid S_t = s\right]$$

-Markov Reward Processes

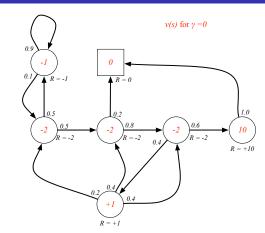

Markov Reward Processes

# Example: Student MRP Returns

# Example: State-Value Function for Student MRP (1)

Sample returns for Student MRP: Starting from  $S_1 = C1$  with  $\gamma = \frac{1}{2}$ 

$$G_1 = R_2 + \gamma R_3 + \dots + \gamma^{T-2} R_T$$

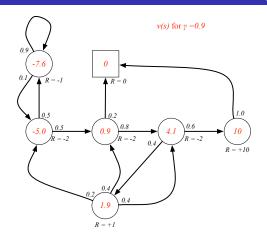

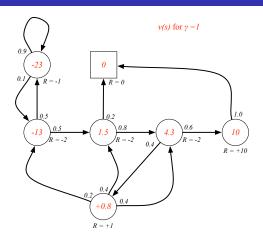

Markov Reward Processes

cture 2: Markov Decision Processes Markov Reward Processes

# Example: State-Value Function for Student MRP (2)

# Example: State-Value Function for Student MRP (3)

# Bellman Equation for MRPs

The value function can be decomposed into two parts:

- $\blacksquare$  immediate reward  $R_{t+1}$
- discounted value of successor state  $\gamma v(S_{t+1})$

$$v(s) = \mathbb{E} [G_t \mid S_t = s]$$

$$= \mathbb{E} [R_{t+1} + \gamma R_{t+2} + \gamma^2 R_{t+3} + \dots \mid S_t = s]$$

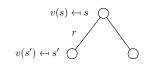

$$= \mathbb{E} [R_{t+1} + \gamma (R_{t+2} + \gamma R_{t+3} + \dots) \mid S_t = s]$$

$$= \mathbb{E} [R_{t+1} + \gamma G_{t+1} \mid S_t = s]$$

$$= \mathbb{E} [R_{t+1} + \gamma V(S_{t+1}) \mid S_t = s]$$

# Bellman Equation for MRPs (2)

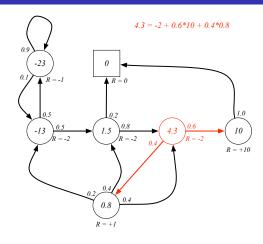

$$v(s) = \mathbb{E}\left[R_{t+1} + \gamma v(S_{t+1}) \mid S_t = s\right]$$

$$v(s) = \mathcal{R}_s + \gamma \sum_{s' \in \mathcal{S}} \mathcal{P}_{ss'} v(s')$$

Markov Reward Processes

## Example: Bellman Equation for Student MRP

-Markov Reward Processes

## Bellman Equation in Matrix Form

The Bellman equation can be expressed concisely using matrices,

$$\mathbf{v} = \mathcal{R} + \gamma \mathcal{P} \mathbf{v}$$

where v is a column vector with one entry per state

$$\begin{bmatrix} v(1) \\ \vdots \\ v(n) \end{bmatrix} = \begin{bmatrix} \mathcal{R}_1 \\ \vdots \\ \mathcal{R}_n \end{bmatrix} + \gamma \begin{bmatrix} \mathcal{P}_{11} & \dots & \mathcal{P}_{1n} \\ \vdots & & \\ \mathcal{P}_{11} & \dots & \mathcal{P}_{nn} \end{bmatrix} \begin{bmatrix} v(1) \\ \vdots \\ v(n) \end{bmatrix}$$

Markov Reward Processes

# Solving the Bellman Equation

- The Bellman equation is a linear equation
- It can be solved directly:

$$v = \mathcal{R} + \gamma \mathcal{P} v$$
$$(I - \gamma \mathcal{P}) v = \mathcal{R}$$
$$v = (I - \gamma \mathcal{P})^{-1} \mathcal{R}$$

- Computational complexity is  $O(n^3)$  for n states
- Direct solution only possible for small MRPs
- There are many iterative methods for large MRPs, e.g.
  - Dynamic programming
  - Monte-Carlo evaluation
  - Temporal-Difference learning

Markov Decision Processes

#### Markov Decision Process

A Markov decision process (MDP) is a Markov reward process with decisions. It is an environment in which all states are Markov.

#### Definition

A Markov Decision Process is a tuple  $\langle S, A, P, R, \gamma \rangle$ 

- lacksquare  $\mathcal S$  is a finite set of states
- $\blacksquare$   $\mathcal{A}$  is a finite set of actions
- $\blacksquare$   $\mathcal{P}$  is a state transition probability matrix,

$$\mathcal{P}_{ss'}^{a} = \mathbb{P}\left[S_{t+1} = s' \mid S_t = s, A_t = a\right]$$

- $lacksymbol{\mathbb{R}}$  R is a reward function,  $\mathcal{R}_{s}^{a} = \mathbb{E}\left[R_{t+1} \mid S_{t} = s, A_{t} = a\right]$
- $\bullet$   $\gamma$  is a discount factor  $\gamma \in [0,1]$ .

# Example: Student MDP

# Facebook R = -1Quit R = 0Facebook R = -1Study R = -2Study R = -2 R = -1Study R = -1 R = -1

# Policies (1)

#### Definition

A policy  $\pi$  is a distribution over actions given states,

$$\pi(a|s) = \mathbb{P}\left[A_t = a \mid S_t = s\right]$$

- A policy fully defines the behaviour of an agent
- MDP policies depend on the current state (not the history)
- i.e. Policies are stationary (time-independent),  $A_t \sim \pi(\cdot|S_t), \forall t > 0$

ecture 2: Markov Decision Process

-Markov Decision Processes

# Policies (2)

- $\blacksquare$  Given an MDP  $\mathcal{M}=\langle\mathcal{S},\mathcal{A},\mathcal{P},\mathcal{R},\gamma\rangle$  and a policy  $\pi$
- The state sequence  $S_1, S_2, ...$  is a Markov process  $\langle \mathcal{S}, \mathcal{P}^{\pi} \rangle$
- The state and reward sequence  $S_1, R_2, S_2, ...$  is a Markov reward process  $\langle S, \mathcal{P}^{\pi}, \mathcal{R}^{\pi}, \gamma \rangle$
- where

$$\mathcal{P}^{\pi}_{s,s'} = \sum_{a \in \mathcal{A}} \pi(a|s) \mathcal{P}^{a}_{ss'}$$
 $\mathcal{R}^{\pi}_{s} = \sum_{a \in \mathcal{A}} \pi(a|s) \mathcal{R}^{a}_{s}$ 

#### Lecture 2: Markov Decision Processe

Markov Decision Processes

#### Value Function

#### Definition

The state-value function  $v_\pi(s)$  of an MDP is the expected return starting from state s, and then following policy  $\pi$ 

$$v_{\pi}(s) = \mathbb{E}_{\pi} \left[ G_t \mid S_t = s \right]$$

#### Definition

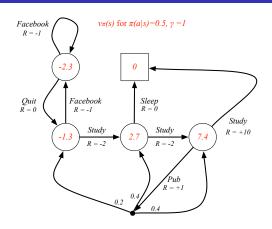

The action-value function  $q_{\pi}(s,a)$  is the expected return starting from state s, taking action a, and then following policy  $\pi$ 

$$q_{\pi}(s, a) = \mathbb{E}_{\pi} \left[ G_t \mid S_t = s, A_t = a \right]$$

ecture 2: Markov Decision Processe

- Markov Decision Processes

# Example: State-Value Function for Student MDP

Markov Decision Processes

Markov Decision Processes

# Bellman Expectation Equation

The state-value function can again be decomposed into immediate reward plus discounted value of successor state,

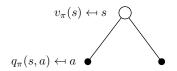

$$v_{\pi}(s) = \mathbb{E}_{\pi} [R_{t+1} + \gamma v_{\pi}(S_{t+1}) \mid S_t = s]$$

The action-value function can similarly be decomposed,

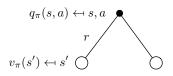

$$q_{\pi}(s, a) = \mathbb{E}_{\pi} [R_{t+1} + \gamma q_{\pi}(S_{t+1}, A_{t+1}) \mid S_t = s, A_t = a]$$

# Bellman Expectation Equation for $V^{\pi}$

# Bellman Expectation Equation for $Q^{\pi}$

$$v_{\pi}(s) = \sum_{a \in \mathcal{A}} \pi(a|s) q_{\pi}(s,a)$$

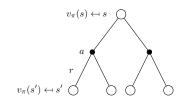

$$q_{\pi}(s, a) = \mathcal{R}_{s}^{a} + \gamma \sum_{s' \in \mathcal{S}} \mathcal{P}_{ss'}^{a} v_{\pi}(s')$$

-Markov Decision Processes

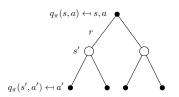

Markov Decision Processes

### Bellman Expectation Equation for $v_{\pi}$ (2)

$$v_{\pi}(s) = \sum_{a \in \mathcal{A}} \pi(a|s) \left(\mathcal{R}_s^a + \gamma \sum_{s' \in \mathcal{S}} \mathcal{P}_{ss'}^a v_{\pi}(s')
ight)$$

# Bellman Expectation Equation for $q_{\pi}$ (2)

$$q_{\pi}(s, a) = \mathcal{R}_{s}^{a} + \gamma \sum_{s' \in \mathcal{S}} \mathcal{P}_{ss'}^{a} \sum_{a' \in \mathcal{A}} \pi(a'|s') q_{\pi}(s', a')$$

Markov Decision Processes

# Example: Bellman Expectation Equation in Student MDP

# 7.4 = 0.5 \* (1 + 0.2\* - 1.3 + 0.4 \* 2.7 + 0.4 \* 7.4)Facebook Sleep R = 0Study Study Study

# Bellman Expectation Equation (Matrix Form)

The Bellman expectation equation can be expressed concisely using the induced MRP,

$$\mathbf{v}_{\pi} = \mathcal{R}^{\pi} + \gamma \mathcal{P}^{\pi} \mathbf{v}_{\pi}$$

with direct solution

$$v_{\pi} = (I - \gamma \mathcal{P}^{\pi})^{-1} \mathcal{R}^{\pi}$$

# Optimal Value Function

#### Definition

The optimal state-value function  $v_*(s)$  is the maximum value function over all policies

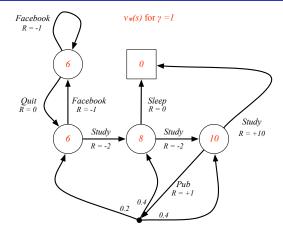

$$v_*(s) = \max_{\pi} v_{\pi}(s)$$

The optimal action-value function  $q_*(s,a)$  is the maximum action-value function over all policies

$$q_*(s,a) = \max_{\pi} q_{\pi}(s,a)$$

- The optimal value function specifies the best possible performance in the MDP.
- An MDP is "solved" when we know the optimal value fn.

# Example: Optimal Value Function for Student MDP

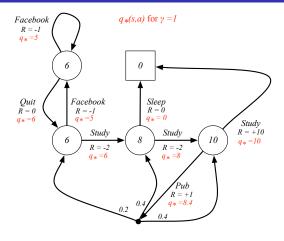

#### Lecture 2: Markov Decision Process

-Markov Decision Processes

#### Lecture 2: Markov Decision Processe

Markov Decision Processes

## Example: Optimal Action-Value Function for Student MDP

# Optimal Policy

Define a partial ordering over policies

$$\pi \geq \pi'$$
 if  $v_{\pi}(s) \geq v_{\pi'}(s), \forall s$ 

#### Theorem

For any Markov Decision Process

- There exists an optimal policy  $\pi_*$  that is better than or equal to all other policies,  $\pi_* \geq \pi, \forall \pi$
- All optimal policies achieve the optimal value function,  $v_{\pi_*}(s) = v_*(s)$
- All optimal policies achieve the optimal action-value function,  $q_{\pi_*}(s,a) = q_*(s,a)$

ecture 2: Markov Decision Processes

Markov Decision Processes

Lecture 2: Markov Decision Processe

Markov Decision Processes

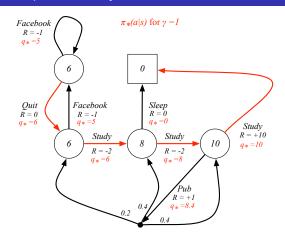

# Finding an Optimal Policy

An optimal policy can be found by maximising over  $q_*(s, a)$ ,

$$\pi_*(a|s) = \left\{ egin{array}{ll} 1 & ext{if } a = ext{argmax } q_*(s,a) \ & a \in \mathcal{A} \ 0 & otherwise \end{array} 
ight.$$

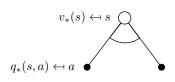

- There is always a deterministic optimal policy for any MDP
- If we know  $q_*(s, a)$ , we immediately have the optimal policy

# Example: Optimal Policy for Student MDP

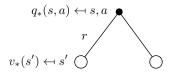

# Bellman Optimality Equation for $v_*$

The optimal value functions are recursively related by the Bellman optimality equations:

$$v_*(s) = \max_a q_*(s,a)$$

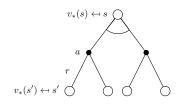

# Bellman Optimality Equation for $Q^*$

$$q_*(s, a) = \mathcal{R}_s^a + \gamma \sum_{s' \in \mathcal{S}} \mathcal{P}_{ss'}^a v_*(s')$$

-Markov Decision Processes

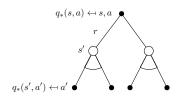

## Bellman Optimality Equation for $V^*$ (2)

$$v_*(s) = \max_{a} \mathcal{R}_s^a + \gamma \sum_{s' \in \mathcal{S}} \mathcal{P}_{ss'}^a v_*(s')$$

Markov Decision Processes

# Bellman Optimality Equation for $Q^*$ (2)

$$q_*(s, a) = \mathcal{R}_s^a + \gamma \sum_{s' \in \mathcal{S}} \mathcal{P}_{ss'}^a \max_{a'} q_*(s', a')$$

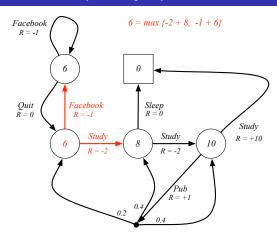

cture 2: Markov Decision Proce

cture 2: Markov Decision Proces Markov Decision Processes

# Solving the Bellman Optimality Equation

# Example: Bellman Optimality Equation in Student MDP

- Bellman Optimality Equation is non-linear
- No closed form solution (in general)
- Many iterative solution methods
  - Value Iteration
  - Policy Iteration
  - Q-learning
  - Sarsa

## Extensions to MDPs

(no exam)

(no exam)

(no exam)

Infinite MDPs

(no exam)

- Infinite and continuous MDPs
- Partially observable MDPs
- Undiscounted, average reward MDPs

The following extensions are all possible:

- Countably infinite state and/or action spaces
  - Straightforward
- Continuous state and/or action spaces
  - Closed form for linear quadratic model (LQR)
- Continuous time
  - Requires partial differential equations
  - Hamilton-Jacobi-Bellman (HJB) equation
  - $\blacksquare$  Limiting case of Bellman equation as time-step  $\to 0$

Lecture 2: Markov Decision Proces

Extensions to MDPs

POMDPs

Lecture 2: Markov Decision Processes

Extensions to MDPs

Belief States

(no exam)

A Partially Observable Markov Decision Process is an MDP with hidden states. It is a hidden Markov model with actions.

#### Definition

A *POMDP* is a tuple  $\langle S, A, \mathcal{O}, \mathcal{P}, \mathcal{R}, \mathcal{Z}, \gamma \rangle$ 

- lacksquare  $\mathcal S$  is a finite set of states
- lacksquare  $\mathcal A$  is a finite set of actions
- O is a finite set of observations
- $\mathcal{P}$  is a state transition probability matrix,  $\mathcal{P}_{ss'}^a = \mathbb{P}\left[S_{t+1} = s' \mid S_t = s, A_t = a\right]$
- **•**  $\mathcal{R}$  is a reward function,  $\mathcal{R}_s^a = \mathbb{E}\left[R_{t+1} \mid S_t = s, A_t = a\right]$
- **Z** is an observation function,

$$\mathcal{Z}_{s'o}^{a} = \mathbb{P}\left[O_{t+1} = o \mid S_{t+1} = s', A_{t} = a\right]$$

 $\bullet$   $\gamma$  is a discount factor  $\gamma \in [0,1]$ .

#### Definition

A history  $H_t$  is a sequence of actions, observations and rewards,

$$H_t = A_0, O_1, R_1, ..., A_{t-1}, O_t, R_t$$

#### Definition

A belief state b(h) is a probability distribution over states, conditioned on the history h

$$b(h) = (\mathbb{P}\left[S_t = s^1 \mid H_t = h\right], ..., \mathbb{P}\left[S_t = s^n \mid H_t = h\right])$$

ecture 2: Markov Decision Processes

Extensions to MDPs

Partially Observable MDPs

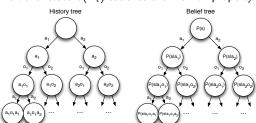

Reductions of POMDPs

Lecture 2: Markov Decision Processes

**Ergodic Markov Process** 

(no exam)

- The history  $H_t$  satisfies the Markov property
- The belief state  $b(H_t)$  satisfies the Markov property

- A POMDP can be reduced to an (infinite) history tree
- A POMDP can be reduced to an (infinite) belief state tree

An ergodic Markov process is

- Recurrent: each state is visited an infinite number of times
- Aperiodic: each state is visited without any systematic period

#### Theorem

An ergodic Markov process has a limiting stationary distribution  $d^{\pi}(s)$  with the property

$$d^{\pi}(s) = \sum_{s' \in \mathcal{S}} d^{\pi}(s') \mathcal{P}_{s's}$$

#### (no exam)

## Average Reward Value Function

(no exam)

#### Definition

Ergodic MDP

An MDP is ergodic if the Markov chain induced by any policy is ergodic.

For any policy  $\pi$ , an ergodic MDP has an average reward per time-step  $\rho^{\pi}$  that is independent of start state.

$$\rho^{\pi} = \lim_{T \to \infty} \frac{1}{T} \mathbb{E} \left[ \sum_{t=1}^{T} R_{t} \right]$$

 $ilde{v}_{\pi}(s) = \mathbb{E}_{\pi}\left[\sum_{k=1}^{\infty}\left(R_{t+k} - 
ho^{\pi}
ight) \mid S_{t} = s
ight]$ 

expressed in terms of average reward.

$$egin{aligned} ilde{v}_\pi(s) &= \mathbb{E}_\pi \left[ \left( R_{t+1} - 
ho^\pi 
ight) + \sum_{k=1}^\infty \left( R_{t+k+1} - 
ho^\pi 
ight) \mid S_t = s 
ight] \ &= \mathbb{E}_\pi \left[ \left( R_{t+1} - 
ho^\pi 
ight) + ilde{v}_\pi(S_{t+1}) \mid S_t = s 
ight] \end{aligned}$$

■ The value function of an undiscounted, ergodic MDP can be

•  $\tilde{v}_{\pi}(s)$  is the extra reward due to starting from state s,

There is a corresponding average reward Bellman equation,

Lecture 2: Markov Decision Processe

Extensions to MDPs

#### Questions?

The only stupid question is the one you were afraid to ask but never did.

-Rich Sutton
